
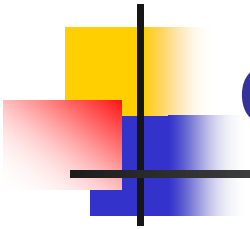
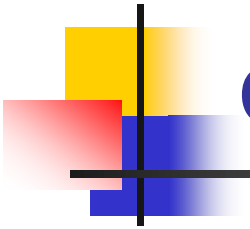
Operating Systems
(Producer consumer problem)

Spring, 2017



Outline

- Objectives
- Programming outlines
- What to do ?



Objectives

- Understanding
  - Produce consumer problem
  - semaphore, mutex

Programming outline -buffer

```
/* buffer.h */
typedef int buffer_item;
#define BUFFER_SIZE 10
```

<관련 함수>

```
#include <pthread.h>
#include <semaphore.h>
pthread_mutex_t mutex;
sem_t empty;
sem_t full;
pthread_mutex_lock(&mutex);
pthread_mutex_unlock(&mutex);
sem_init(&empty, 0, 5);
sem_post(&empty);
sem_wait(&empty);
```

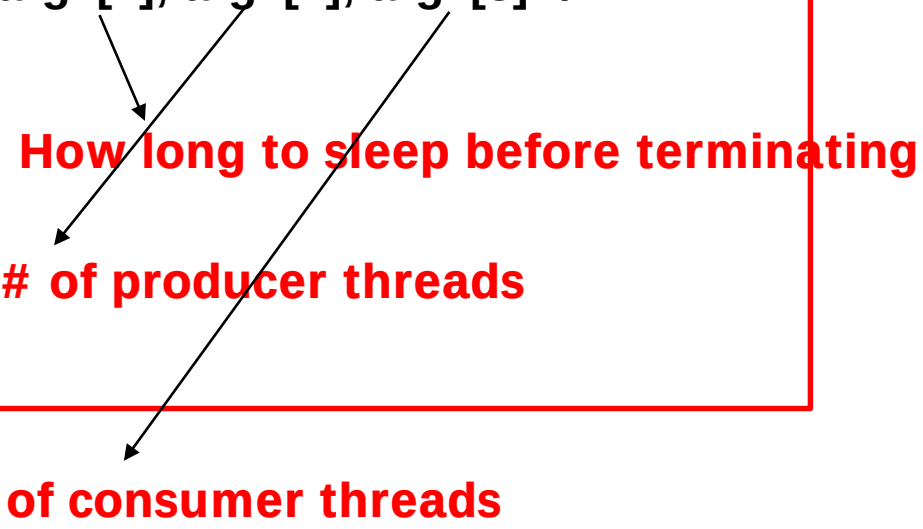
Programming outline –main function

```
#include “buffer.h”

int main(int argc, char *argv[]){

 /* 1. Get command line arguments argv[1], argv[2], argv[3] */
 /* 2. Initialize buffer */
 /* 3. Create producer thread(s) */
 /* 4. Create consumer thread(s) */
 /* 5. Sleep */
 /* 6. Exit */

}
```



Programming outline – functions

```
#include “buffer.h”

/* the buffer */
buffer_item buffer[BUFFER_SIZE];

int insert_item(buffer_item item){
        /* insert item into buffer
        return 0 if successful, otherwise
        return -1 indicating an error condition */
}

int remove_item(buffer_item *item){
        /* remove an object from buffer placing it in item
        return 0 if successful, otherwise
        return -1 indicating an error condition */
}
```

Threads

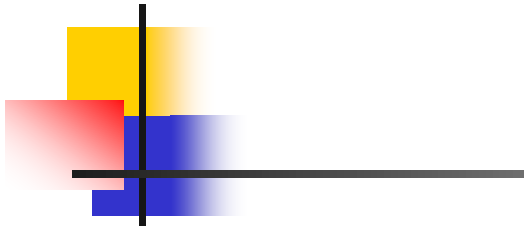
```
#include <stdlib.h>                /* required for rand() */
#include “buffer.h”

void *producer(void *param){
        buffer_item item;

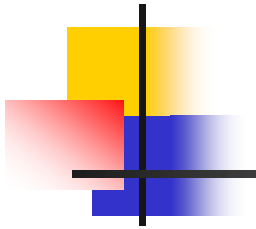
        while(true){
                /* sleep for a random period of time */
                sleep(…);
                /* generate a random number between 1 and 100 */
                item = rand();
                if(insert_item(item))
                        fprintf(“report error condition”);
                else
                        printf(“producer produced %d\n”, item);
        }
}

void *consumer(void *param){
        buffer_item item;

        while(true){
                /* sleep for a random period of time */
                sleep(…);
                if(remove_item(&item))
                        fprintf(“report error condition”);
                else
                        printf(“consumer consumed %d\n”, item);
                }
}
```



- Two monitoring threads
  - 1> Producer monitoring thread
    - A monitoring thread checks whether the producer thread generates a number between 1 and 50
    - If so
      - It grants buffer insertion
    - Otherwise
      - It rejects buffer insertion
    - Meanwhile, the producer thread must be blocked
      - The producer thread receives the result (insertion or not)
    - Use semaphore or mutex mechanism for synchronization



- The second monitoring thread
  - 2> Consumer monitoring thread
    - A monitoring thread checks whether the consumer thread consumes a number between 1 and 25
    - If so
      - It grants consumption
    - Otherwise
      - It divides the original number by 2
        - 47: 23
        - 48: 24
    - Meanwhile, the consumer thread must be blocked
      - The consumer thread receives the result (number)
    - Use semaphore or mutex mechanism for synchronization

What to do?

- What to do ?
  - 강의 노트를 참조해서 producer consumer problem 을 구현할 것
  - 어떻게 검증할 것인지를 기술할 것
    - 2개의 monitoring thread 가 동작하는 것을 검증함
  - 보고서에 2개의 monitoring thread 에 대해서 기술할 것
    - semaphore, mutex 사용에 대해서 기술할 것
- No submission after the deadline
- Deadline : May 14th
